Presentation outline

- **Background**
- **Motivation**
- **SMODEX**
- **Use case**
- **Conclusion**
- **What next?**

1. Background

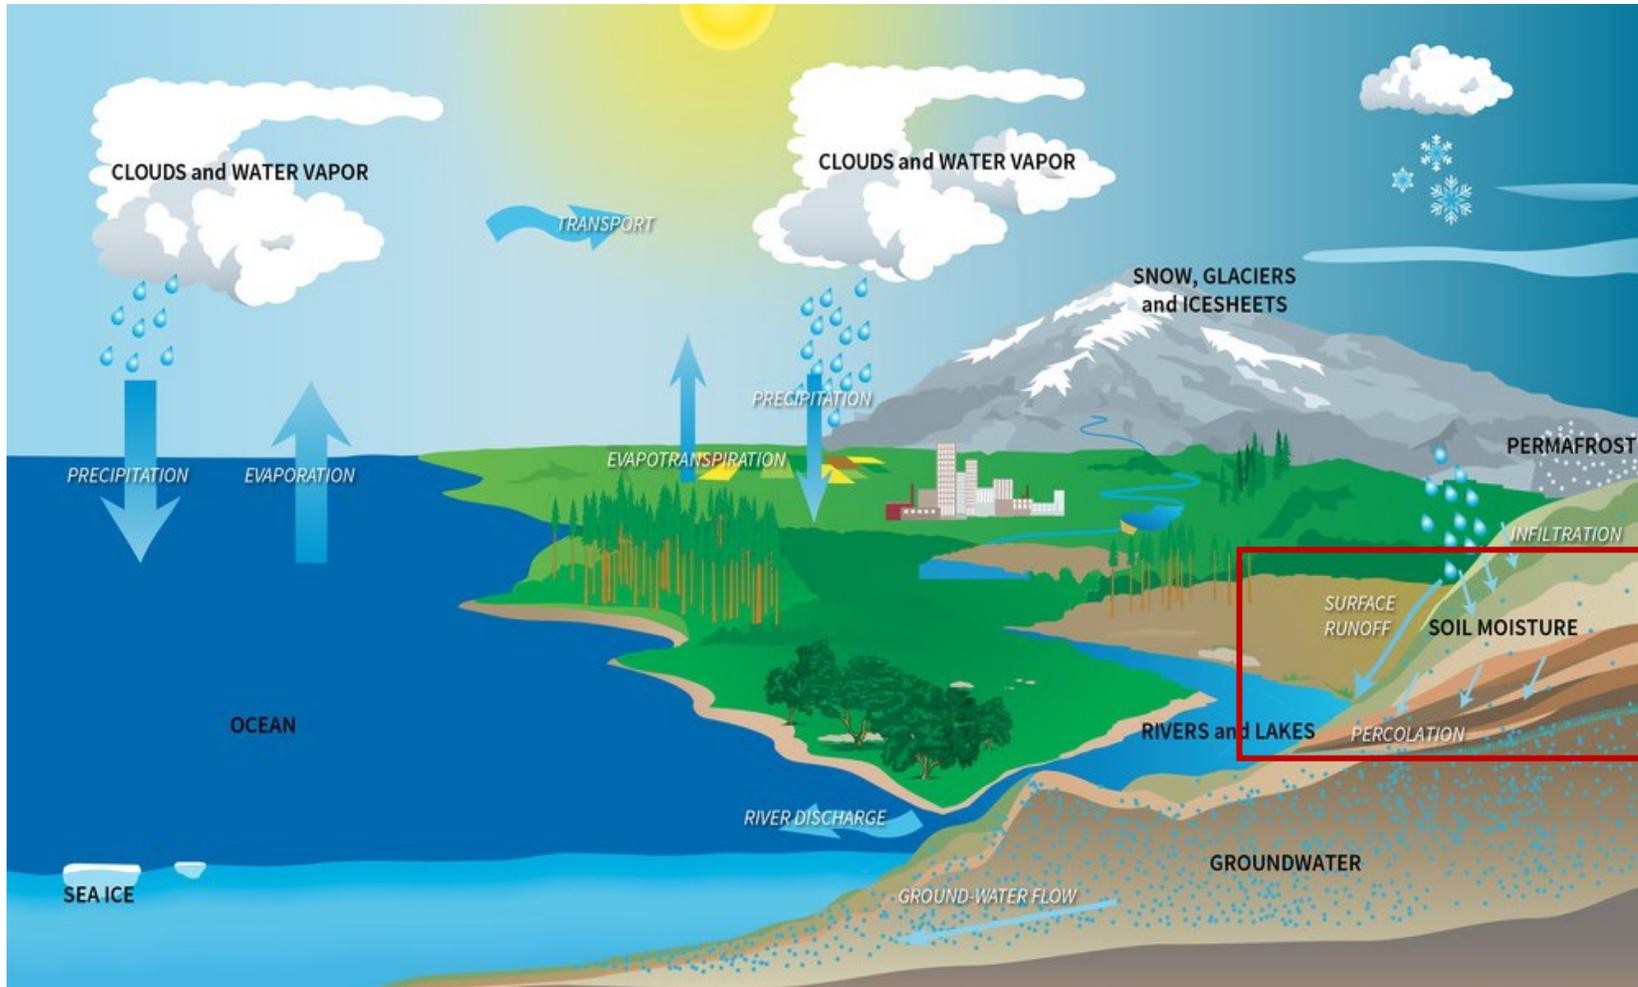

The Global Water Budget

The global water budget is under pressure with significant effects on many downstream sectors (FAO, 2021).

Source: Modeling the Water Budget, NASA JPL:
<https://www.jpl.nasa.gov/edu/teach/activity/modeling-the-water-budget/>

The Global Water Budget

The global water budget is under pressure with significant effects on many downstream sectors (FAO, 2021).

Soil moisture is a critical parameter used in understanding the hydrological cycle.

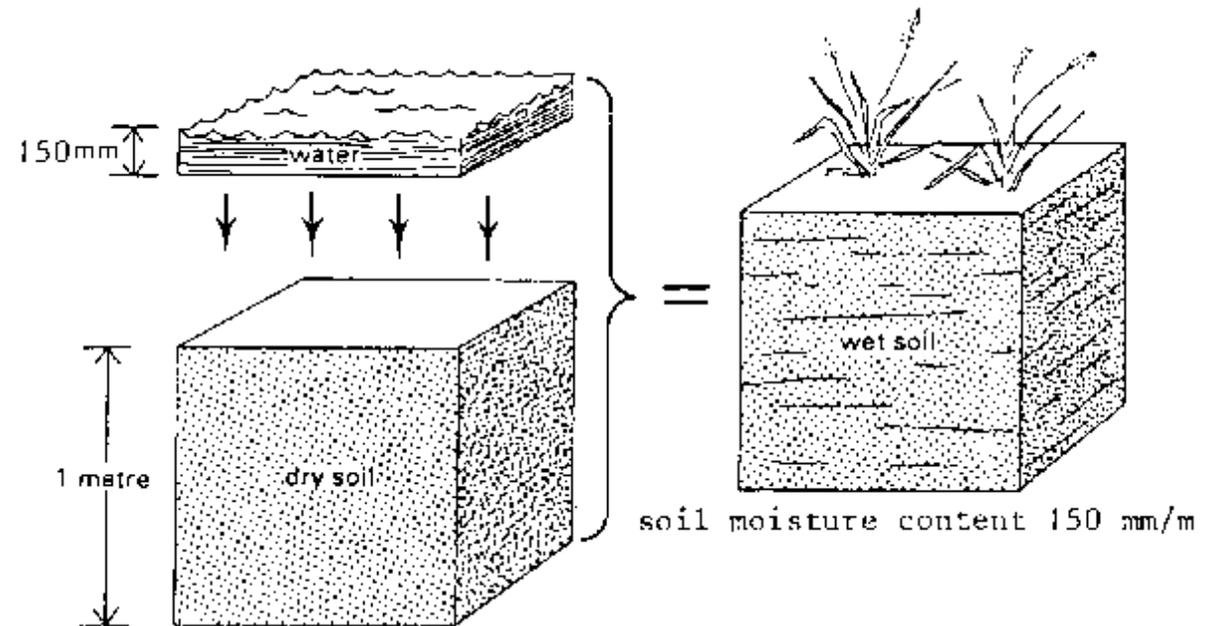

Source: Modeling the Water Budget, NASA JPL:
<https://www.jpl.nasa.gov/edu/teach/activity/modeling-the-water-budget/>

Soil Moisture

Soil moisture content is the measurement of the amount of water held in soil expressed in mm of water depth.

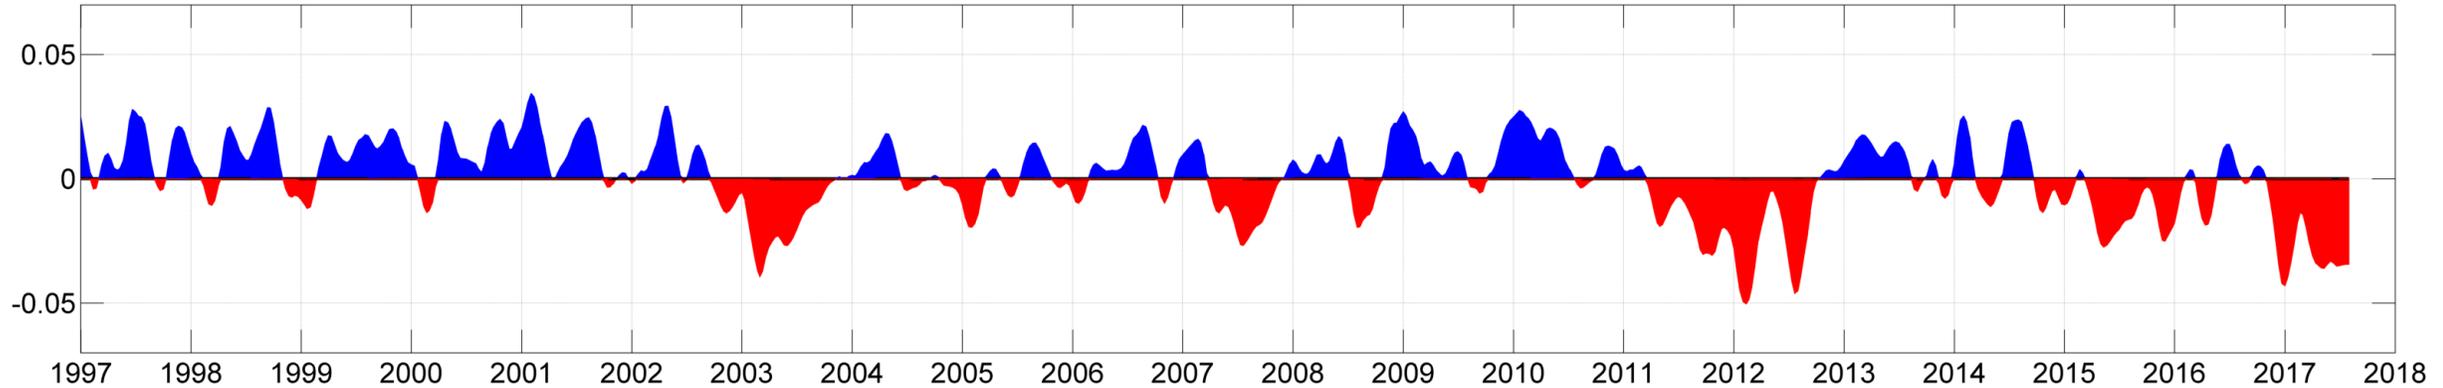

Useful application in:

- Sustainable farming and agricultural practices,
- Flood and erosion control, and
- Drought monitoring and prediction.

Source: Irrigation Water Management: Training Manual, Food and Agricultural Organization (FAO). Chapter 2: Soil and Water: <https://www.fao.org/3/r4082e/r4082e03.htm>

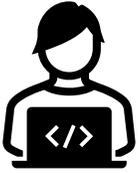

Soil Moisture Anomalies

Source: Annual Soil Moisture Anomalies over Italy (1997 to 2018), European Space Agency, https://www.esa.int/ESA_Multimedia/Images/2017/09/Italy_soil_moisture_anomalies

“Soil Moisture Anomaly is a climatic indicator used to detect and monitor the start and duration of agricultural drought and other dryness/wetness conditions”

2. Motivation

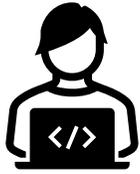

Why smodex?

- ❑ Soil moisture and soil moisture anomalies are reliable predictors for dryness/ wetness conditions,
- ❑ Climatic analysis can involve multiple steps and processing chains,
- ❑ Climatic analysis are often computationally demanding,

3. smodex package

pip install smodex

smodex

smodex – an acronym for soil moisture indices.

A tool for accessing, analyzing and sharing soil moisture data and information.

Data Access

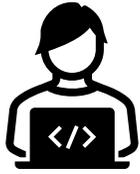

Computation

Visualization

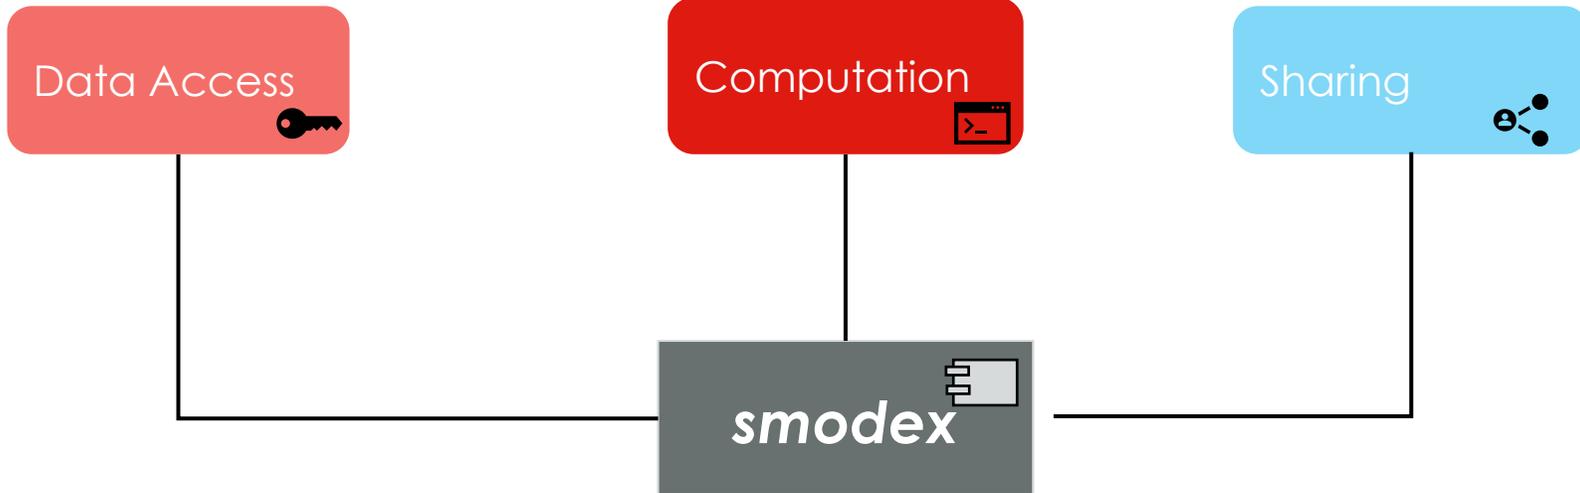

Sharing

The screenshot shows the PyPI page for the smodex package. At the top, there's a search bar and navigation links (Help, Sponsors, Log In, Register). The package name 'smodex 1.0.1b0' is prominently displayed, along with a 'pip install smodex' button and a 'Latest version' indicator. Below this, a brief description states: 'A Python package for understanding the evolution of soil moisture and soil moisture anomalies'. The page is divided into several sections: 'Navigation' (Project description, Release history, Download files), 'Project links' (Homepage), 'Statistics' (Libraries.io, Google BigQuery), 'Meta' (License: MIT No Attribution, Author: Rufai Omowunmi Balogun), and 'Package Usage' (Soil moisture and soil moisture anomalies are critical markers of dryness and agricultural drought. The SMODEX package was designed to aid the performant of this metrics targeting the following categories of users: 1. Researchers working on the topics of soil moisture, drought and soil hydrology, 2. Students exploring tools for understanding the dynamics of soil moisture and soil hydrology, 3. Open-source and Open-science scientists looking for a wrapper to compute these specific anomalies). The 'Installation' section notes compatibility with Python 3.6+ and provides the command 'pip install smodex'. The 'Usage examples' section is also visible.

Getting Started

The goal of the smodex package is to ensure the seamless computation of soil moisture anomalies from climate datasets. Hence, the main steps involved in this computation have been simplified to:

1. Data Loading,
2. Climatology computation,
3. Anomalies computation,
4. Data visualization, and
5. Data sharing

In this page, we walk you through how to utilize the main functionalities of the `smodex` package to perform these actions. Ensure you have the smodex package, you can consult the installation guide for the different ways of installing the package in your development environment.

1. Data Loading

The smodex downloader module provides functionalities that enables you access datasets from the [ERA5 Climate Data Store](#) by specifying the details of the requested datasets in a JSON file and providing all the necessary information for downloading the datasets you need. To do this, follow the following steps:

1. Step 1. Ensure you have the `ERA5 CDS API` installed in your development environment. This can be done by:

```
pip install cdsapi
```

This provides all the necessary functionalities and backends for accessing the CDS datasets.

Next to this, create a configuration file (JSON file) that contains all the data specification for the data you would like to request, example:

```
{  "product_type": "reanalysis",  "variable": [    "volumetric_soil_water_layer_1",    "volumetric_soil_water_layer_2",    "volumetric_soil_water_layer_3",    "volumetric_soil_water_layer_4"  ],  "year": 1981,  "month": [ "01", "02", "03" ],  "day": [ "03", "08", "16", "24", "30" ],  "time": [ "08:00", "06:00", "12:00", "18:00" ],  "area": [ 47.148, 18.255, 46.297, 12.542 ],  "format": "netcdf"}
```

This JSON file in general should contain the information on your **Area of Interest** and other specific information on the datasets you would like to download.

1. Step 2. Specify the time range (start date and end date) and download your data to the specified path:

STAC

SpatioTemporal Asset Catalogs

The STAC specification is a **common language to describe geospatial information**, so it can more easily be worked with, indexed, and discovered.

```
{  
  "stac_version": "1.0.0",  
  "type": "Feature",  
  "id": "20201211_223832_CS2",  
  "bbox": [],  
  "geometry": {},  
  "properties": {},  
  "collection": "simple-collection",  
  "links": [],  
  "assets": {}  
}
```

4. Conclusion

smodex is:

- ❑ an **open-source** python tool for:
 - i.) accessing climate datasets,
 - ii.) computing soil moisture indicators, and
 - iii.) sharing generated datasets with other scientists in an open-source standard-compliant way
- ❑ provides **functionalities** for
 - i.) spatial and temporal analysis,
 - ii.) data resampling, and
 - iii.) sharing (accessible metadata)
- ❑ **Extensible** to:
 - i.) accessing data from other earth observation/climate data APIs, and
 - ii.) computing new indicators

What next?

- Extend **data access** to other earth observation APIs,
- Extend **data computation** to workflow for soil moisture estimation and anomalies from other high-resolution earth observation datasets,
- Provide a **CLI tool** to enable easy adoption of computations in high-performance computing environment,
- Extend tools based on user's requests for specific downstream functionalities
